

ABSTRACT OF THE DISCLOSURE

An intuitive computer data management system, includes a UI (User Interface), a categorizing module, and an accessing module. The UI provides at least one prompt to a user so that the user can follow the prompt to send an access request for computer readable data in one action. The categorizing module automatically determines the type of computer readable data according to the access request given by the user. The accessing module then processes the computer readable data according to the determined type.
